GREENHAVEN ANIMAL RESCUE

Organisation Overview

GreenHaven animal Rescue is a non-profit organization that has been established in the 2010's, to be specific 2018. This organization was created to increase number of abandoned and homeless pets in urban areas. The organisation focuses on rescuing animals that have been abandoned, neglected, or found without suitable homes. After rescue, animals are provided with temporary shelter, basic care, rehabilitation, and assistance in finding suitable permanent homes. Animal rescuers relies on the community involvement, volunteers, donations, and sponsorships to support its operations and continue providing care to animals.

Mission Statement

The mission of GreenHaven Animal Rescue is to reduce animal homelessness through compassionate shelter management, responsible adoption, and community education. The aims of this organization is to ensure that rescued animals receive appropriate care while they wait for suitable permanent homes. Its vision is to create communities where animals are treated responsibly, and having fewer pets abandoned or left without proper care.

Target Audience:

The people who have interest in animal welfare and want to support or interact with the organization.

Animal lovers who cannot adopt, but would like to volunteer their time are also important.

Website Goals and objectives

The primary goal of the GreenHaven Animal Rescue website is that I create an accessible online platform that connects the organisation with members of the community. The website will make it easier for adopters to view animals currently available for adoption and learn about the adoption process. It will also provide a structured volunteer enquiry system through which people can indicate their interests, availability and areas they would like to assist.

Key Performance Indicators (KPIs):

One KPI will be the number of monthly visits to the adoption and pet-profile sections of the website.

Another will be the number of volunteer enquiry forms completed by people interested in assisting at the shelter.

Other useful measurements could include adoption enquiry submissions, contact-form submissions, repeat visitors, and the number of visitors who interact with specific pet profiles.

Current website analysis

GreenHaven Animal Rescue currently has an outdated website that does not provide an effective experience for modern users. We have identified that one of the main issues is existing website is not fully responsive, meaning that its layout and content will not display correctly on smaller mobile screens. This will also make it difficult for visitors to browse available animals or complete important actions using smartphones. The website also lacks a functional online volunteer application system and interested individuals to rely on alternative communication methods.

Proposed Website Features and Functionality

The proposed website will contain a minimum of five core pages that provide visitors with information about the organisation and its services.

- The **index.html** page will serve as the homepage and will contain a hero banner showcasing seasonal floral arrangements, introductory content, navigation links, and clear call-to-action buttons.
- The **about.html** page will provide information about the history of GreenHaven Animal Rescue.
- The **services.html** will function as the pets and services section, displaying adoptable animals through profile cards containing information such as the animal's name, type, age, personality, and adoption status.
- The **enquiry.html** page will contain a volunteer and sponsor enquiry form where users can submit their details and indicate how they would like to support the organisation.
- The **contact.html** page will provide practical information that customers need when communicating with or visiting the business. It will also include the physical shop address, telephone contact details, email address, operating hours, and an interactive location map where appropriate.

Design and User Experience (UX)

The visual design of GreenHaven Animal Rescue will use a welcoming and natural colour scheme that reflects the organisation's connection to animals, nature, and community care.

The primary colour palette will be;

Leaf Green

Warm Amber

Light Slate

The website will use a card-based user interface for displaying pet profiles because this allows information about individual animals to be presented in an organised and visually engaging manner.

Each card can contain an animal photograph, name, age, type, short description, and adoption status. The layout will also use responsive CSS techniques to ensure that cards and navigation elements adjust appropriately on mobile devices.

Technical Requirements

The website will be developed using standard web technologies consisting of semantic

- HTML5
- CSS
- JavaScript.

HTML5 will be responsible for creating the structure and content of each webpage using appropriate semantic elements such as headers, navigation sections, main content areas, forms, and footers.

CSS3 will be used to control the visual appearance of the website, including colours, typography, spacing, layouts, animations, and responsive behaviour.

JavaScript will be used to provide client-side interactivity and functionality without depending on external JavaScript frameworks.

Timeline and Budget

The proposed development timeline will consist of three main phases covering approximately five weeks.

Phase 1, during Weeks 1–2, will focus on gathering requirements, defining the website's objectives, developing the sitemap, and creating the initial HTML structure.

Phase 2, during Weeks 3–4, will focus on implementing the CSS design, developing responsive layouts, adding images and content, and conducting initial user-interface testing.

Phase 3, during Week 5, will focus on JavaScript functionality, form validation, final testing, fixing identified issues, and preparing the website for deployment. This phased approach will make it easier to monitor progress and ensure that the main components of the website are completed before the final deployment stage.
